- 1** A distributed algorithm for generalized deadlock detection 97%
 Gabriel Bracha , Sam Toueg
Proceedings of the third annual ACM symposium on Principles of distributed computing August 1984
An efficient distributed algorithm to detect deadlocks in distributed and dynamically changing systems is presented. In our model, processes can request any N available resources from a pool of size M. This is a generalization of the well-known AND-OR request model. The algorithm is incrementally derived and proven correct. Its communication, computational, and space complexity compares favorably with those of previously known distributed < ...
 - 2** The Kala basket: a semantic primitive unifying object transactions, 94%
 access control, versions, and configurations
Sergui S. Simmel , Ivan Godard
ACM SIGPLAN Notices , Conference proceedings on Object-oriented programming systems, languages, and applications November 1991
Volume 26 Issue 11
 - 3** Efficient asynchronous distributed symmetry breaking 88%
 Baruch Awerbuch , Lenore J. Cowen , Mark A. Smith
Proceedings of the twenty-sixth annual ACM symposium on Theory of computing May 1994
